## The 3 key takeaways

- **Growth:** Weakening amid increasing concerns about stagflation
- **Inflation:** Slower progress toward 2% U.S. target, with uncertain impacts from latest tariffs
- **Rates:** Federal Reserve (Fed) on hold—internationally, more cuts are needed

### GROWTH: MORE TARIFFS IN APRIL

With the larger-than-anticipated U.S. trade tariffs announced on April 2, growth uncertainty has increased, and we expect that the magnitude by which the global macro environment (growth and inflation) will evolve from here will be volatile. Factors that matter the most include how tariffs are implemented and what reciprocal measures may be implemented by U.S. trading partners.

Our base case is that growth expectations will likely take a hit sooner and inflation expectations will become less anchored over coming weeks and months. U.S. net exports may take years to show a meaningful shift from these tariffs as supply chains and prices reorganize. Prices are unlikely to fall in the short term, despite consumers' already-weak spending, because businesses generally pass the financial impact of tariffs on to consumers in order to protect margins. The Trump administration's tariffs announced thus far appear to have exceeded market expectations, triggering strong negative reactions across asset classes. With the volatility, we see potential opportunities revealed for active managers across asset classes when coupled with prudent risk management.

Internationally, growth has stabilized, although the latest European purchasing managers' data came in weaker than expected, indicating more stimulus is needed to lift consumer sentiment. Germany's announcement of additional fiscal stimulus has created positive sentiment toward European manufacturing, but it's unclear how much this will affect domestic consumption. The considerable fiscal stimulus expected in Europe overall might lift employment and domestic consumption if the money finds its way into private-sector innovation and job creation, over the long term. China's growth continues to benefit from technology innovation, including artificial intelligence developments, and some stabilization in consumer sentiment and the property market.

### INFLATION: CONCERNS OVER TARIFFS' IMPACT ON PRICES

The latest U.S. inflation reading came in a touch lower than expected, with February's core inflation at 3.1% versus the 3.2% expected. That said, the Fed upgraded its short-term price forecasts and consumers expect higher inflation from more expensive imports. In addition to

the latest tariffs, several other measures the Trump administration is taking, such as curbing immigration and focusing on domestic production, will likely drive structurally higher prices, and domestic wages should increase. Commodity prices have been increasing in 2025 due to tariff worries and sharp increases for metals, including copper and gold. Climbing commodity prices could make it more difficult for central banks to manage inflation. Sticky inflation combined with slowing growth data has ignited fears of stagflation.

Outside the U.S., Germany surprised with a lower-than-expected February inflation reading, which might give the European Central Bank (ECB) more room to cut rates this year. In China, inflation dipped into negative territory again. Despite seasonal reasons for the negative reading, the country's overall consumer prices trend remains deflationary.

## RATES: FED ON HOLD, WITH GROWTH VERSUS INFLATION TRADE-OFF WORSENING

As expected, the Fed left rates unchanged in March, and as long as we don't see signs of a U.S. recession, the Fed will likely stay on hold while assessing incoming data carefully. With the increased trade and growth uncertainties, U.S. growth could easily drop by half—to 1.2% year over year compared with 2024—and the Fed may cut rates more meaningfully in the second half of 2025. As a result, the short-term interest rate market has moved closer to three rate cuts by year-end, up from two cuts at the start of 2025.

U.S. Treasury bonds and international bonds have both been supported by hopes of more rate cuts this year. While fiscal stimulus in the eurozone and the U.S. could make interest rate decisions more difficult over the short term, we expect the ECB and the Bank of England (BoE) to continue rate cuts this year, eventually joined by the Fed later in the year. Although the market expects two more cuts from the ECB and BoE in 2025, we wouldn't rule out a more aggressive approach if growth data remain lackluster.

## SERVICES SECTOR SLOWING FROM A PEAK WHILE MANUFACTURING SECTOR BACK IN CONTRACTION

Sources: Allspring and Bloomberg Finance L.P. Data range is 01-Aug-22 through 01-Mar-25.

A Manufacturing Purchasing Managers' Index (PMI) measures the activity level of purchasing managers in the manufacturing sector. You cannot invest directly in an index.

A Services PMI gauges activity level in industries with a less tangible product, such as financial services, health care, and hospitality. You cannot invest directly in an index.

Purchasing Managers' Indexes are measured in numbers above and below the neutral central midpoint of 50. On this chart, the PMI readings have been normalized, which means that 50 is represented by zero (calculated by subtracting 50 from each actual reading); readings above zero represent expansion in activity, and readings below zero represent contraction in activity.

Past performance is not a reliable indicator of future results.

## IMPLICATIONS FOR FIXED INCOME

With increasing global trade uncertainty and central banks still cautious about adding more stimulus before inflation targets are hit, we believe bond markets should continue doing well. Yields remain attractive overall.

We believe U.S. bonds will remain supported and earn the carry. Interest rates will likely continue falling on the short end of the curve, though probably not before the third quarter of 2025. Farther out on the curve, there's likely more interest rate volatility ahead because tariffs can potentially increase inflation through higher import prices and a weaker U.S. dollar. We expect the interest rate curve to continue steepening in the second half of 2025 as the market starts rebuilding a term premium into long-maturity bonds. We favor higher-quality U.S. bonds with low- to medium-term durations that are less affected by interest rate and growth volatility.

International bonds remain supported by lower growth and inflation, although this is largely priced in already. We'll need to see the full effects of the fiscal stimulus through defense spending and how much of it will drive personal consumption higher, rather than the savings rate. We remain positive on international bonds for now.

### **IMPLICATIONS FOR EQUITIES**

We've become more cautious on equities in the short term and continue to expect a shift away from the highly concentrated areas of U.S. equities toward more diversified areas, including international equities. A weaker U.S. dollar and lower rates internationally combined with the expected negative impact of U.S. trade tariffs on U.S. consumers have led to international equities' outperformance. Potentially lower geopolitical risk could boost international stock markets and more fiscal spending could boost U.S. equities, but one of the main drivers remains the fundamental outlook on inflation and how the Fed decides to react going forward.

We expect the global equity market's broadening to continue—including emerging markets supported by cheaper valuations, lower real rates, weaker currencies, and more Chinese stimulus. Focusing on quality and valuation remains a prudent approach for us.

### **IMPLICATIONS FOR MULTI-ASSET PORTFOLIOS**

Since the beginning of 2025, we've been adding to our international equity exposure while reducing U.S. equity exposure. European, emerging market, and Chinese equities could offer good diversification as the rally broadens. We continue to like bonds over cash, especially on the international side. With growth concerns outweighing inflation concerns, we expect to see the equity/bond correlation turn negative again, enabling bonds to become an effective risk diversifier relative to equities. Tariff concerns will likely keep introducing short-term volatility—we'll need to see how this ultimately affects economic growth. Currently, we favor shorter maturities because we expect a steepening yield curve in Europe. We remain underweight the U.S. dollar given the increased likelihood of trade tariffs triggering negative side effects on growth and inflation.

### **POTENTIAL ALLOCATIONS BASED ON TODAY'S ENVIRONMENT**

The table below depicts our views on short-term trends. These perspectives are developed using quantitative analysis of data over the past 30 years overlaid with qualitative analysis by Allspring investment professionals. The positioning of each bar in the table shows the direction and magnitude of an overweight.
